**Moving at the Speed of Change** 

May 2015

- Automation is intended to:
  - Increase efficiency of test organization
  - Increase effectiveness of test effort
  - Reduce costs
- Maintenance
  - Erodes the return on investment gained from test automation
  - Only a small portion of your resources should be spent on maintaining existing automated tests

### **Maintenance Costs**

Moving at the Speed of Change

May 2015

- Choosing the right tests to automate
- Separating test requirements, object definitions, test functions and test data
- Building small reusable components
- Generating expected results at runtime
- Creating robust object definitions

### **5 Ways to Minimize Maintenance**

Moving at the Speed of Change

May 2015

- Good candidates
  - Short or simple transactions
  - Universal tests
  - Many data combinations
  - Expected results are stable or easy to generate at runtime

#### Poor candidates

- Long or complex transactions
- One-offs
- Unstable application
- Difficult to predict results

### **Choosing What To Automate**

Moving at the Speed of Change

May 2015

- Tests that can be executed with minimal navigation
  - Data type validations
  - Data content validations
    - Invalid password
    - record not found
  - Missing required fields

### **Short or Simple Tests**

#### Moving at the Speed of Change

- Credit Card Application
  - Single page
  - Lots of data validation
    - Field formats
      - Dates
      - Phone numbers
      - Social Security numbers
    - Field lengths
    - Invalid characters
    - Missing required fields
    - Confirmation fields
  - Hundreds of combinations

### **Example**

**Moving at the Speed of Change** 

May 2015

- Tests that can be run against each window or page in the application under test
  - Standards
    - Labels must include a colon
    - Dialogboxes must include Closebox
    - Radio group can not have more than 3 choices
  - Z order
  - Min and max button size
  - Field length

### **Universal Tests**

```
□ class VerifyFieldLength : Step

    parameter AppObject FieldName

    parameter Integer FieldLength

 ■ Main ()
   ♦ String TestString = ""
    TestString = String.Replicate("a",FieldLength)
   FieldName.SetValue(TestString + "x")
    *

    FieldName.VerifyValue(TestString)

    *
    return
```

Moving at the Speed of Change

May 2015

- Path through the application is shared by many tests
- Lots of different combinations of data need to be tested
- Write a reusable data-driven test
  - Separate test steps from test data
  - Relatively little work for a lot of coverage
  - Could pay for themselves in first run

### **Many Data Combinations**

#### Moving at the Speed of Change

- POS Sale Transaction
  - Definite path through the application
  - Easy to encapsulate GUI steps
  - Transactions executed with
    - Different tenders
    - Different items
    - In different states (taxes)
    - With different discounts

### **Example**

#### May 2015

Ξ	Р	05	5 I	Regression				
	Ξ	S	ale	es				
□R			R	egular Sale				
<b>♦</b>			<b>\langle</b>	Cash				
<b>♦</b>		0	Personal Check	_				
			<b>&lt;</b>	Travel Check	_			
			<b>\ \</b>	Gift Card				
♦ M			<b>\langle</b>	Merch Voucher				
			Ξ	Credit				
				◇ Visa				
				◇ Discover	_			
		Ξ	D	iscounted Sale				
			<b>\ \</b>	Transaction Percent Off1				
<b>♦</b>		<b>\ \</b>	Transaction Dollar Off					
<b>♦</b>		<b>&lt;</b>	Disaster Discount					
			<b>\ \</b>	Design/Pref Business				
			<b>\ \</b>	Technique Class	_			
			<b>&lt;</b>	Gift Reg Completion				
			<b>\ \</b>	District Imporve Fee				

#### Moving at the Speed of Change

May 2015

- Test requirements/objectives
  - What needs to be tested
- Tests
  - Ordered list of steps for satisfying test requirements
- Application object definitions
  - Insulating tests from changes in the GUI
- Test steps, units, functions
  - How application is traversed, manipulated and verified
- Test data
  - Inputs to and expected results of tests

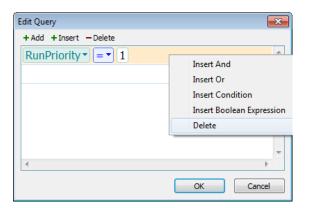

### **Separation of Test Components**

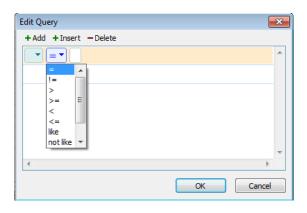

Moving at the Speed of Change

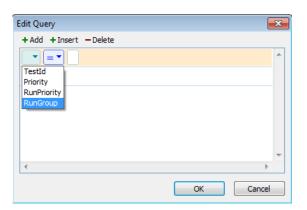

May 2015

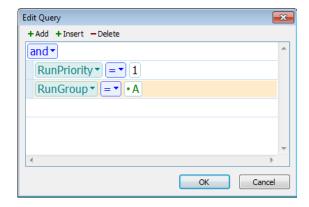

- Describes what needs to be tested
  - Does not describe test steps
  - Does not describe how tests will be executed
  - Does not describe the data that will be used to execute test cases
- Graphical representation
  - Outline notation
  - Easy to understand coverage at a glimpse

### **Automation Ready Test Plans**

Moving at the Speed of Change

May 2015

- Create tests that call reusable units
  - Automated tests should not contain GUI-specific actions
  - Automated tests should call units that encapsulate GUIspecific steps so that they can be reused by other tests
  - An Automated test should order the steps that need to be completed to satisfy the requirements of the test

### **Test Architecture**

Moving at the Speed of Change

May 2015

- Navigational steps
  - Invoke
  - Close

- Input steps
  - Page specific
  - Universal

- Verification steps
  - Page specific
  - Universal

set	InformationRequest.FirstName • Value

    InfoRequest.PhoneNumber.SetValue ("")

    InfoRequest.Email.SetValue ("")

    InfoRequest.ConfirmEmail.SetValue ("")

   InfoRequest.Submit.Click ()
```

Moving at the Speed of Change

May 2015

- Capture from application
  - At runtime during the test when the data is not dictated by test case requirements
- Capture from application data sources
  - Look up data in application database if available (SKUs, Prices)
- Store in format where data can be easily created and maintained

### **Test Data**

Moving at the Speed of Change

May 2015

- Universal Verification Approach
  - The Expected Result is
    - generated based on inputs
    - is used as the baseline
  - A reusable verification function compares data sets that are captured from the AUT at runtime
  - For each 'l-value' in the baseline, the function compares all the 'r-values'

### **Small Reusable Components**

Moving at the Speed of Change

May 2015

- Retail web site order entry
  - Products are selected randomly or specifically
  - Product attributes such as SKU, Description, Qty and Price are captured as part of the test
  - Same product attributes can be captured from the shopping cart, review order and submitted order pages
  - All attributes are written to a data store such as an .ini file

### **Example**

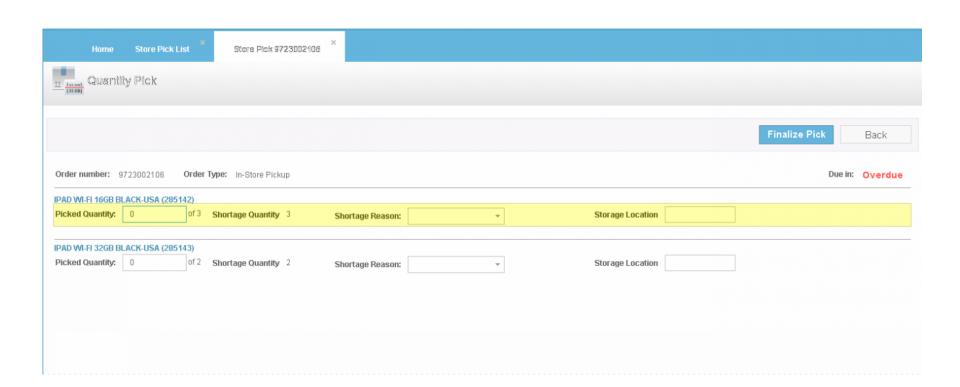

**Predicted Results:** Shopping Cart Capture: [RegularSale1] [RegularSale1] Item3\_Style=528534 Item3 Style=528534 Item3 Price=29.99 Item3 Price=29.99 Item3 Taxable=N Item3 Taxable=N Item3 Dept=40 Item3 Dept=40 TaxState=MA TaxState=MA TaxRate=5.00 TaxRate=5.00 Review Order Capture SubTotal=29.99 SubTotal=29.99 [RegularSale1] Total=31.49 Item3 Style=528534 Total=31.49 Item3 Price=29.99 Item3 Taxable=N Item3 Dept=40 TaxState=MA TaxRate=5.00 SubTotal=29.99 Total=31.49

**Moving at the Speed of Change** 

May 2015

- Create Object Definitions/GUI Map rather than recording dynamic objects
- Use stable attributes
  - Field labels
  - Internal Window identifiers
- Do not use attributes that may change at runtime
  - Absolute location or RECT
- Dynamically define objects when it makes sense

### **Robust Object Definitions**
